## Abstract

This Labbook describes the development of metabolic dynamic models of CORN

## 1 Introduction

Modeling is a powerful tool in synthetic biology. It can provide us with an important engineering approach to characterize our pathways quantitatively and predict their performance, thus help us test and modify our design.

Through the dynamic model, we hope to gain insights of the characteristics of our whole circuit's dynamics. Several tools including ODEs and interpolation are employed.

## 2 Method

Figure 1: Schematic diagram of plasmid1

At the beginning, on the plasmid#1, the promoter  $P_{arsR}$  isn't bound with ArsR, thus it is active. *ArsR* and *smURFP* are transcribed and translated under the control of the promoters  $P_{arsR_u}$  and  $P_{arsR_d}$ , with subscript *u* and *d* representing upstream and downstream separately. The subscript *l* of smURFP in the equation

means leaky expression without the expression of  $As^{3+}$ . As ArsR is expressed gradually, it will bind with the promoter  $P_{arsR}$  and make it inactive.

On the plasmid#2, the fusion protein of dCas9 and RNAP(RNA polymerase) are produced after transcription and translation, and  $sgRNA$  is produced after transcription.

Figure 2: Schematic diagram of dCas9/RNAP

dCas9(\*RNAP) can bind with its target DNA sequence without cutting, which is at the upstream of the promoter  $P_{arsR_d}$ . Simultaneously, dCas9 can lead RNAP to bind with the promoter  $P_{arsR_d}$  and enhance the transcription of smURFP. However, because the promoter  $P_{arsR_d}$  has already bound with ArsR, as a result, RNAP can't bind with the promoter  $P_{arsR_d}$ .

However, at the presence of  $As^{3+}$ , it can bind with ArsR, then dissociate ArsR and  $P_{arsR_d}$ , which makes the combination of RNAP and  $P_{arsR_d}$  possible.

(Declaration:  $[dCas9/RNAP] = [dCas9] = [RNAP]$ ;  
 $[P_{arsR_d}] = [P_{arsR_u}] = \frac{1}{2}[P_{arsR}]$  )

We then take degradation into account:

## 2.1 simulation

SimBiology toolbox provides functions for modeling, simulating, and analyzing biochemical pathways on basis of the powerful computing engine of Matlab.

COPASI is freeware developed with collaboration of VBI and EMLR. It provides almost the same functions as SimBiology, though not quite powerful. But compared with SimBiology, it provides a friendly user interface for model analysis, such as parameter estimation, and parameter scan.

Through the figure, we can see that the smURFP fluorescence gradually increased and then reached a steady state after a period of time in the presence of arsenic ions.

Table 1: Parameters

Rate constants	Value	units
k1	1.999e-5	1/s
k2	3.312e-6	1/s
k3	3.3e7	1/M
k4	1.995e-5	1/s
k5	3.312e-6	1/s
k6	1.66e7	1/M
k7	1.26e4	1/s
k8	1.6e-2	1/s
k9	1.66e-5	1/s
k10	4e-5	1/s
kd1	3.07e-3	1/s
kd2	1e-5	1/s
kd3	1e-3	1/s
kd4	1.53e-3	1/s
kd5	2e-2	1/s
kd6	7.62e-3	1/s
kd7	1e-2	1/s
kd8	1e-1	1/s
